

Replace McClellan Transmission Main

The McClellan Transmission Main is currently a 10-inch cast iron pipe. The pipe is undersized and creates difficulty when filling the tank. The existing main was originally constructed in the 1930's and is beyond its design life. Replacing this main with 16-inch diameter main will enable the Wylie Wells to fill the McClellan Tank and better utilize the City's McClellan water source. The city is receiving a \$2 million competitive grant from ARPA Phase 2 Allocation. This money will be used to complete this project. This project will be bid in the fall of 2023.
